

Table S1. Genes coding for proteins retrieved from the Human Cancer Secretome Database (HCSD) (www.cancersecretome.org). Studies available in HCSD (see reference PMID) were conducted using label-based methods in seven cancer types (colorectal, esophageal, gastric, glioblastoma, head and neck cancer, lung, pancreatic cancers) and 35 neoplastic and 3 non-neoplastic cell lines. Genes were selected when Log2 Fold-Change were > 1 or < -1.
