

## Supplementary methods

### 1. Methods for label free proteomic analysis

#### 1.1 Protein extraction and trypsin digestion

For each FFPE sample, 3-4 sections 15-20 µm each were obtained and combined in a 2 ml eppendorf tube for further processing. This included, deparaffinization through three incubations in xylene (first two for 5 min each and the last for 1 min), each one followed by centrifugation for 3 min at 13,000 rpm at room temperature (RT). The sections were then rehydrated through a series of ethanol and distilled water washes (100% ethanol for 2 min, 95% ethanol for 1 min, 70% ethanol for 1 min, distilled water for 1 min), each one followed by centrifugation for 3 min at 13,000 rpm, at RT. Upon rehydration, the tissue pellets were left to air dry for 30 min at RT. The samples were resuspended in 200 µl of FASP buffer (pH ~ 8), containing 100 mM Tris-HCl, 4 % SDS, 100 mM DTE. For homogenization, 0.9 - 2.0 mm stainless steel beads were added to the samples and placed at the bullet blender homogenizer in 2 sequential steps: 5 min in at speed 12 and 3 min in at speed 10. The homogenates were sonicated for 3 cycles of 5 seconds each using a tip sonicator (36% power used), followed by 1 h of heating at 90 °C on a heating block. Then, the extracts were centrifuged for 10 min at 13,000 rpm at RT and the supernatants (~170 µl) were transferred in to new 1.5 ml eppendorf tubes. Trypsin was added at 1:50 trypsin-to-protein mass ratio for digestion overnight at 37 °C. The hydrolysates was reduced with 5 mM dithiothreitol for 30 min in 56 °C and alkylated with 11 mM iodoacetamide for 15 min at room temperature in darkness. Then the tryptic peptides were desalted with SPE column and dried by vacuum centrifuging.

#### 1.2 LC-MS/MS Analysis

The tryptic peptides were dissolved in solvent A (0.1% formic acid, 2% acetonitrile/ in water), directly loaded onto a home-made reversed-phase analytical column (25-cm length, 100 µm i.d.). Peptides were separated with a gradient from 6%

to 24% solvent B (0.1% formic acid in acetonitrile) over 70 min, 24% to 35% in 14 min and climbing to 80% in 3 min then holding at 80% for the last 3 min, all at a constant flow rate of 450 nL/min on a nanoElute UHPLC system (Bruker Daltonics). The peptides were subjected to Capillary source followed by the timsTOF Pro (Bruker Daltonics) mass spectrometry. The electrospray voltage applied was 1.70 kV. Precursors and fragments were analyzed at the TOF detector, with a MS/MS scan range from 100 to 1700 m/z. The timsTOF Pro was operated in parallel accumulation serial fragmentation (PASEF) mode. Precursors with charge states 0 to 5 were selected for fragmentation, and 10 PASEF-MS/MS scans were acquired per cycle. The dynamic exclusion was set to 30 s.

### 1.3 Database Search

The resulting MS/MS data were processed using MaxQuant search engine (v.1.6.15.0). Tandem mass spectra were searched against the Homo Sapiens database (SwissProt, 20395 entries) concatenated with reverse decoy database. Trypsin/P was specified as cleavage enzyme allowing up to 2 missing cleavages. The mass tolerance for precursor ions was set as 20 ppm in First search and 20 ppm in Main search, and the mass tolerance for fragment ions was set as 0.02 Da. Carbamidomethyl on Cys was specified as fixed modification, and acetylation on protein N-terminal and oxidation on Met were specified as variable modifications. FDR was adjusted to < 1%.

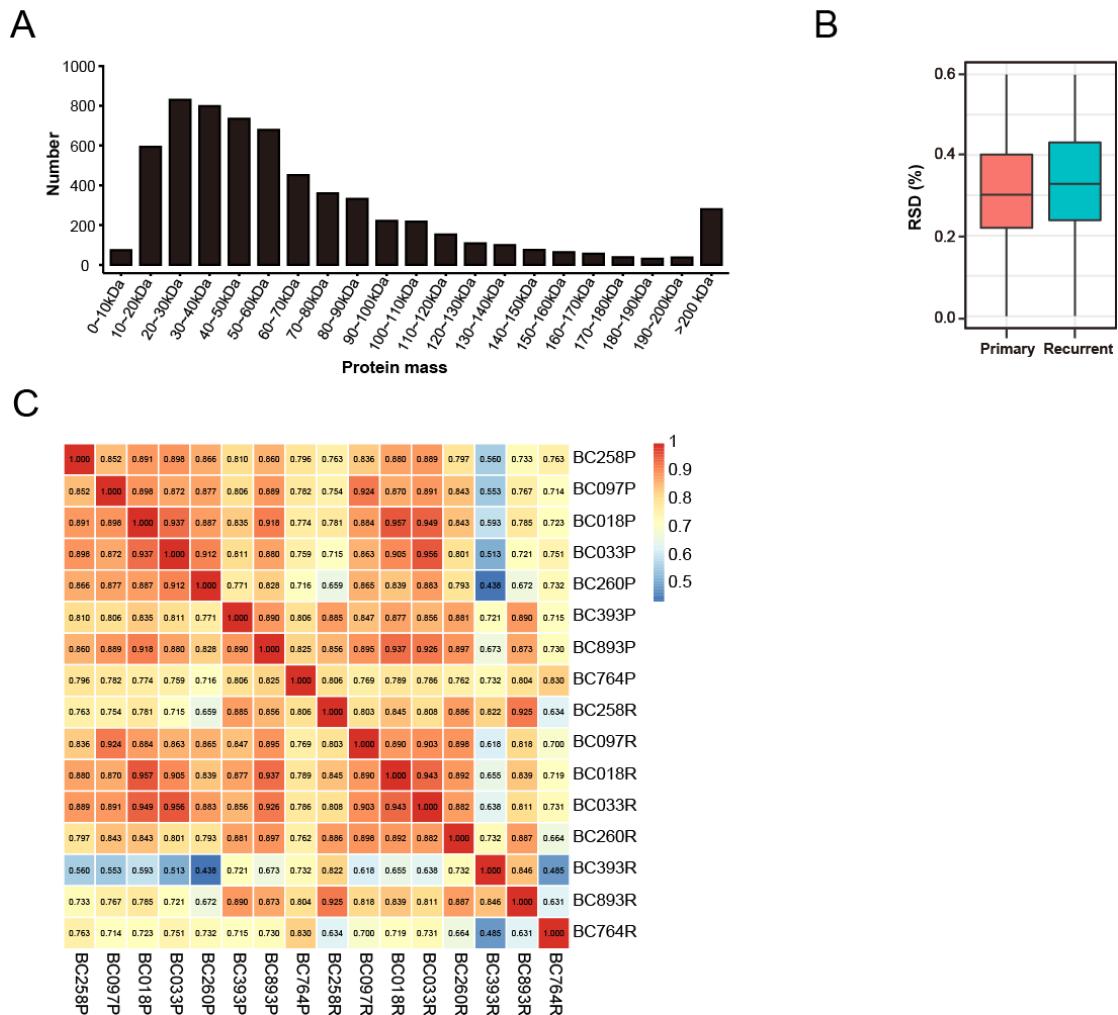

## 2. Methods for lentivirus packaging and infection

Lentiviral expression Lv105 plasmids encoding empty vector (EV) or NIBAN1 were obtained from Genecopoeia Inc. Lentiviral shRNA plasmids encoding scramble control, shNIBAN1, and shFAK/PTK2 were also provided by Genecopoeia Inc. The sequences for the shRNAs and control shRNA used in this study are listed as follows:  
NIBAN1 shRNAs: sh-1: CCAAGGCC ACCATTGGCGCCTG; sh-2:  
CAGCCCTTGTGGTCCTGCC. Scramble control:  
CCTAAGGTTAACGTCGCCCTCG. These lentiviral plasmids were cotransfected into 293FT cells with a Lentiviral Packaging Kit (Genecopoeia) to obtain recombinant

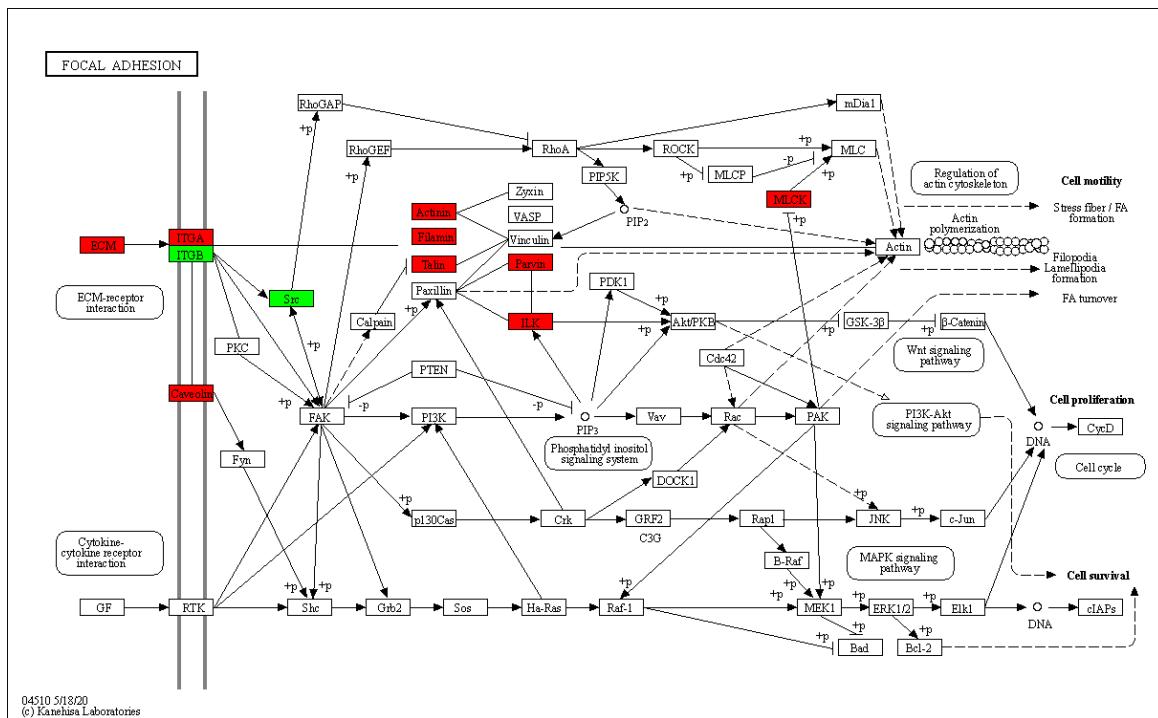

lentiviruses.

For the generation of stable cell lines, bladder cancer cells were cultured in 60mm culture dishes overnight. The collected recombinant lentiviruses supplemented with 8 µg/ml polybrene were added to the adherent cells. After 48 h of viral infection, the supernatant was replaced with fresh medium containing 1 µg/ ml puromycin, and incubated for 1 week.

## Supplementary figures

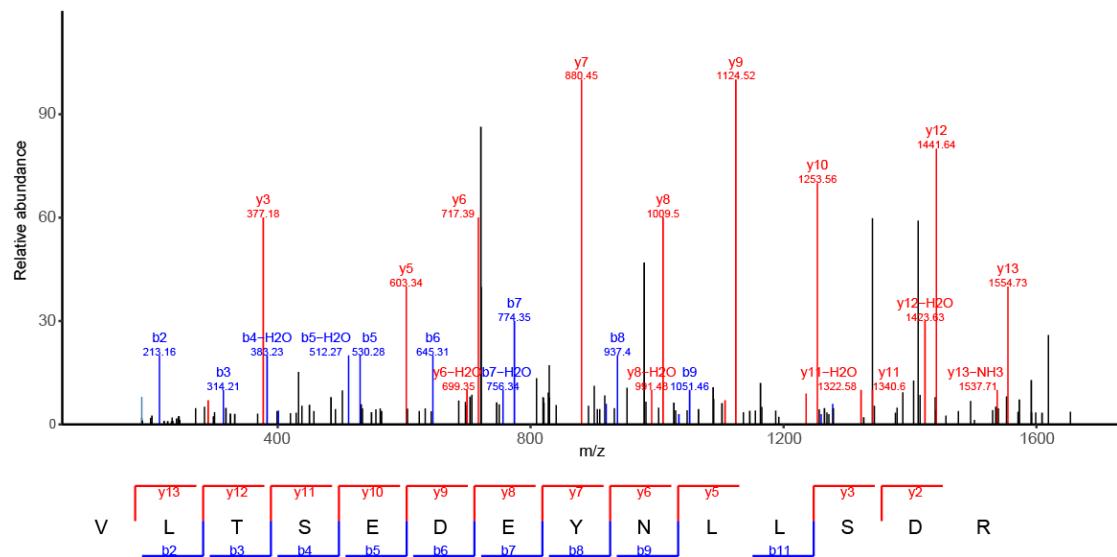

**Figure S1:** **A.** Distribution of protein mass of identified proteins. **B.** Relative standard deviation (RSD) of proteomic data of primary/recurrent NMIBCs. **C.** The heatmap of Pearson correlation coefficients between paired primary and recurrent NMIBCs

**Figure S2:** Graphical network map of KEGG *Focal adhesion* pathway. Red, up-regulated proteins; green, down-regulated proteins.

Raw file	Scan number	Mass analyzer	Score	m/z	Proteins
B1453260_Slot2-16_1_10790	50830	TOF	178.65	827.402	Q9BZQ8

**Figure S3:** The mass spectrum of NIBAN1 unique peptide (VLTSEDEYLNLLSDR).

Table S1: The clinicopathological information associated with paired primary/recurrent specimens

Case. No	Sex	Age	Time. diagnosis	Time. recurrence	Time to recurrence (months)	Tumor stage
