Supplementary Figures and Tables

Figures S1-6

Tables S1-3

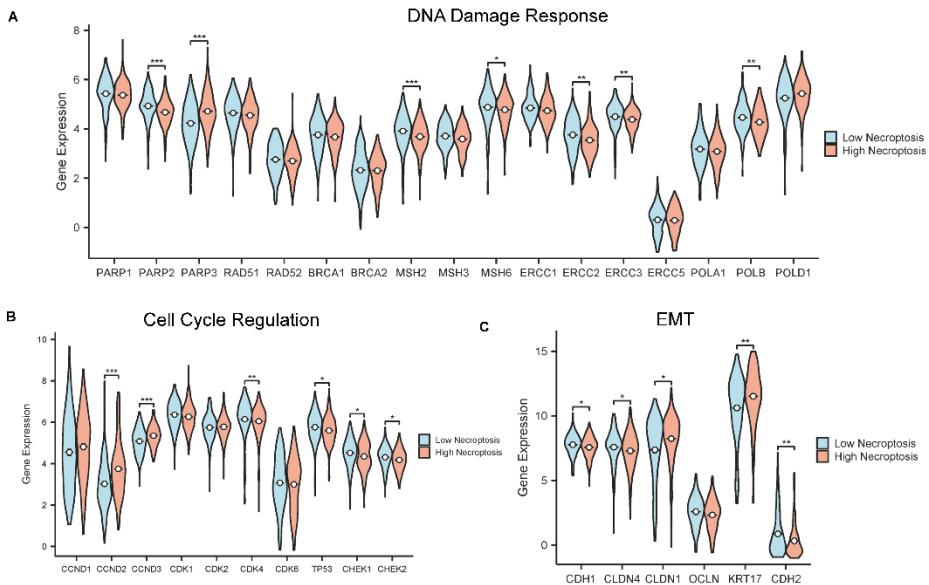

Fig. S1 (A) The expression of DNA damage response-related genes in low necroptosis and high necroptosis group in cervical cancer patients (p-Value: *** p < 0.001, ** p < 0.01, * p <0.05). **(B)** The expression of Cell cycle regulation-related genes in low necroptosis and high necroptosis group in cervical cancer patients (p-Value: *** p < 0.001, ** p < 0.01, * p <0.05). **(C)** The expression of EMT-related genes in low necroptosis and high necroptosis group in cervical cancer patients (p-Value: ** p < 0.01, * p <0.05).

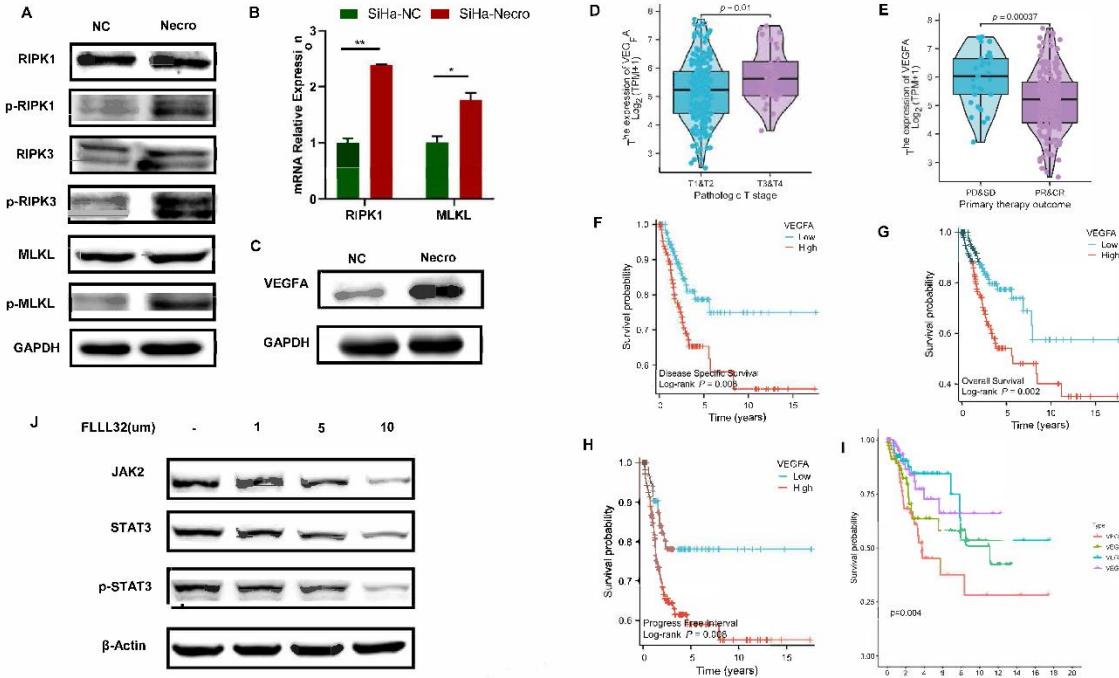

Fig. S2: In vitro experiments confirmed the induction of necroptosis and bioinformatic analyses identified the role of VEGFA in CC. (A) The protein levels of RIPK1, p-RIPK1, RIPK3, p-RIPK3, MLKL and p-MLKL in the necroptosis group were found to be significantly higher than those observed in the normal control group. “NC” means normal control, “Necro” means treated with necroptosis inducer. (B) RT-qPCR showed an increased expression level of RIPK1 and MLKL in the necroptosis group (p-Value: ** $p < 0.01$, * $p < 0.05$, ns $p > 0.05$). (C) The protein level of VEGFA was significantly elevated in the presence of the necroptosis inducer. (D) Distribution of gene expression in T stage classification, by Kruskal-Wallis rank sum test. (E) The correlation of gene expression with primary therapy outcome, by Kruskal-Wallis rank sum test. (F-H) The prognostic values of VEGFA expression in CC patients. Patients were marked with high expression or low expression depending on comparing with the median expression level, Kaplan-Meier (KM) survival analysis portrayed the effects of VEGFA expression on the disease-free survival (F), overall survival (G) and progress free interval (H) in TCGA-CESC cohort, p-

Value was calculated by log-rank test. **(I)** Survival analysis revealed CC patients with high expression level of VEGFA and high necroptosis were more likely to have the worst outcome. **(J)** The protein level of JAK2, STAT3 and p-STAT3 exhibited a decreased trend with the addition of FLLL32.

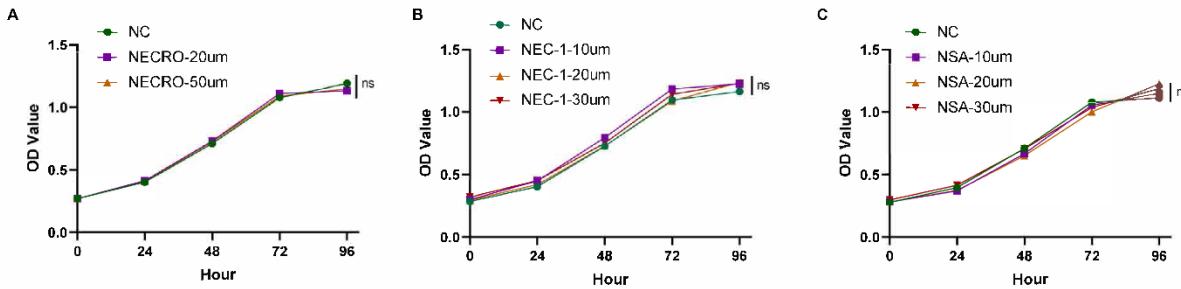

Fig. S3: Necroptosis had no effect on Jurkat cell proliferation. (A-C) Results of CCK-8 assays showed that at times of 24, 48, 72 and 96 h, the viability of Jurkat cells was not affected whether treated with necroptosis inducer (A) or necroptosis inhibitor NEC-1 (B) and NSA (C) at different concentrations (p-value: ns $p > 0.05$). “NC” means normal control, “NECRO” means treated with necroptosis inducer, “NEC-1” means treated with NEC-1, “NSA” means treated with NSA.

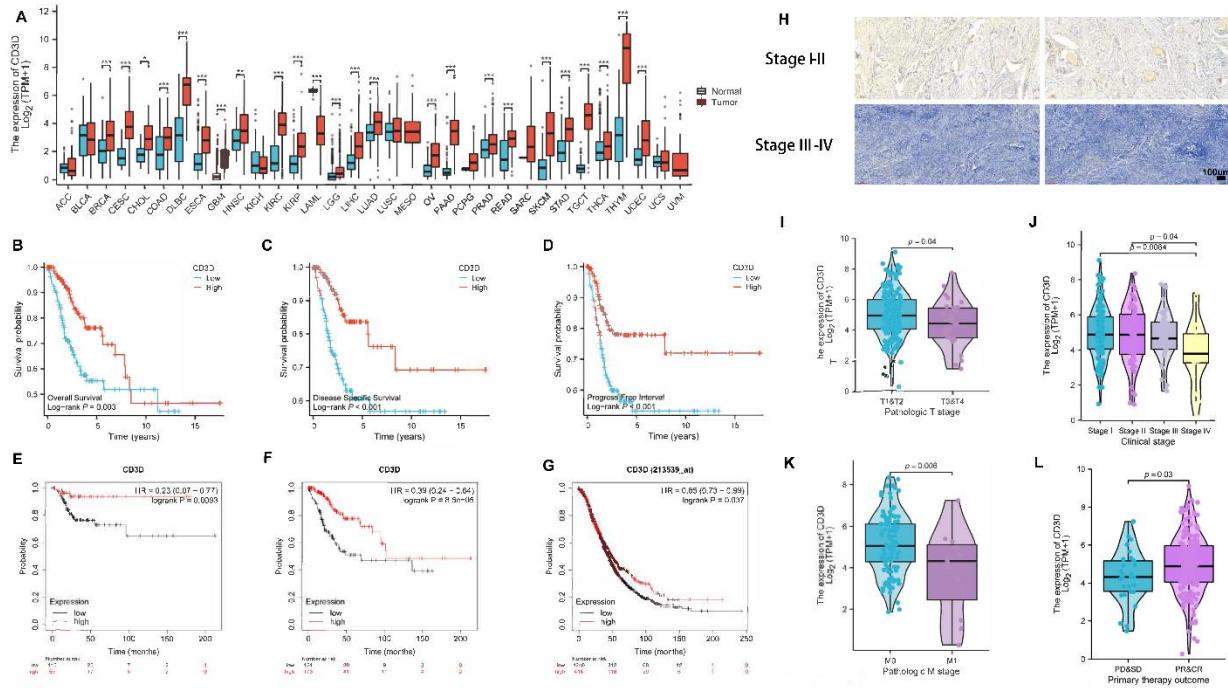

Fig. S4: Bioinformatic analyses revealed CD3D emerged as a protective factor in CC patients.

(A) Pan-cancer analysis of CD3D expression in tumorous and normal samples were displayed (p-Value: *** p < 0.001, ** p < 0.01, * p < 0.05, ns p > 0.05). **(B-D)** The prognostic values of CD3D expression in CC patients. Patients were marked with high expression or low expression depending on comparing with the median expression level, Kaplan-Meier (KM) survival analysis portrayed the effects of CD3D expression on the overall survival (B), disease-free survival (C) and progress free interval (D) in TCGA-CESC cohort, p-Value was calculated by log-rank test. **(E-G)** The correlation of CD3D expression with overall survival using the Kaplan-Meier plotter. **(H)** The expression of CD3D protein in I-II stage and III-IV stage CC tissues was detected by IHC (magnification $\times 100$). **(I-K)** Correlation analysis of CD3D expression with clinicopathological characteristics of CC patients. Pathologic T stage classification (I), Clinical stage classification (J) and Pathologic M stage classification (K) was displayed respectively, by Kruskal-Wallis rank sum

test. (L) The correlation of CD3D expression with primary therapy outcomes of CC patients, Wilcoxon rank sum was applied for the significance test.

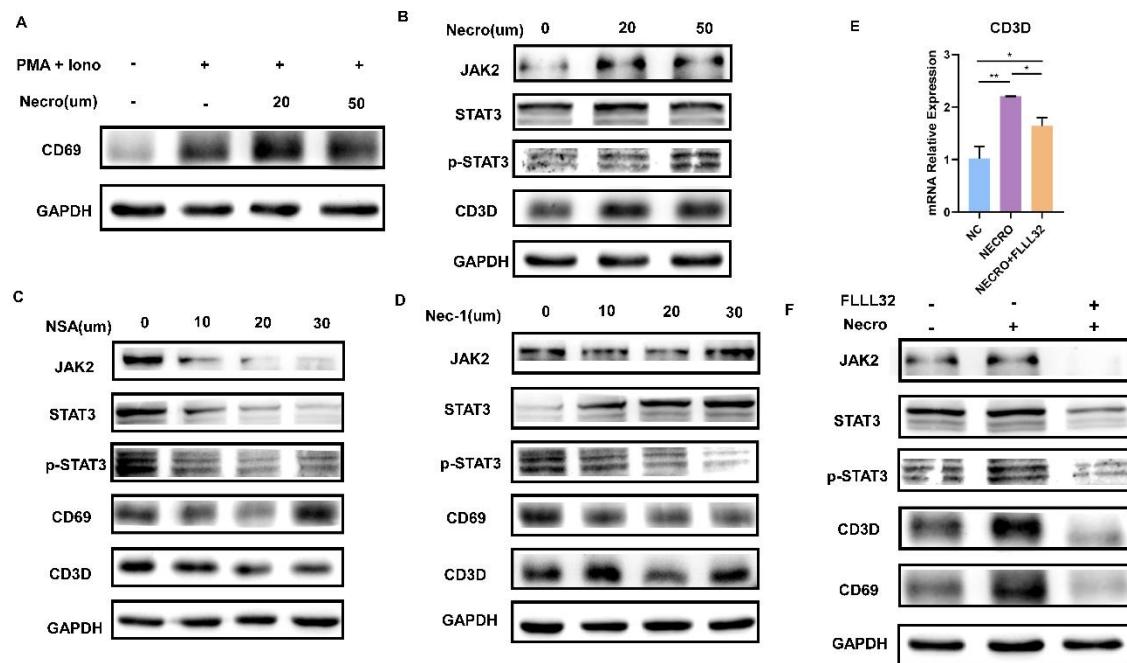

Fig. S5: Necroptosis up-regulates CD3D via JAK2-STAT3 signaling pathway in activated T cells. (A) The protein level of CD69. **(B)** The protein level of JAK2, STAT3, p-STAT3 and CD3D in activated T cells was much stronger with the induction of necroptosis. **(C, D)** The protein level of JAK2, STAT3, p-STAT3, CD3D and CD69 exhibits to decrease in the condition of NSA (C) or Nec-1 (D). **(E)** RT-qPCR results revealed CD3D expression of activated T cells was higher in the treatment of necroptosis inducer and this effect was inhibited by FLLL32 (p-Value: ** p < 0.01, * p < 0.05, ns p > 0.05). **(F)** The protein level of JAK2, STAT3, p-STAT3, CD3D and CD69 exhibits to decrease in the condition of necroptosis and this effect was inhibited by FLLL32.

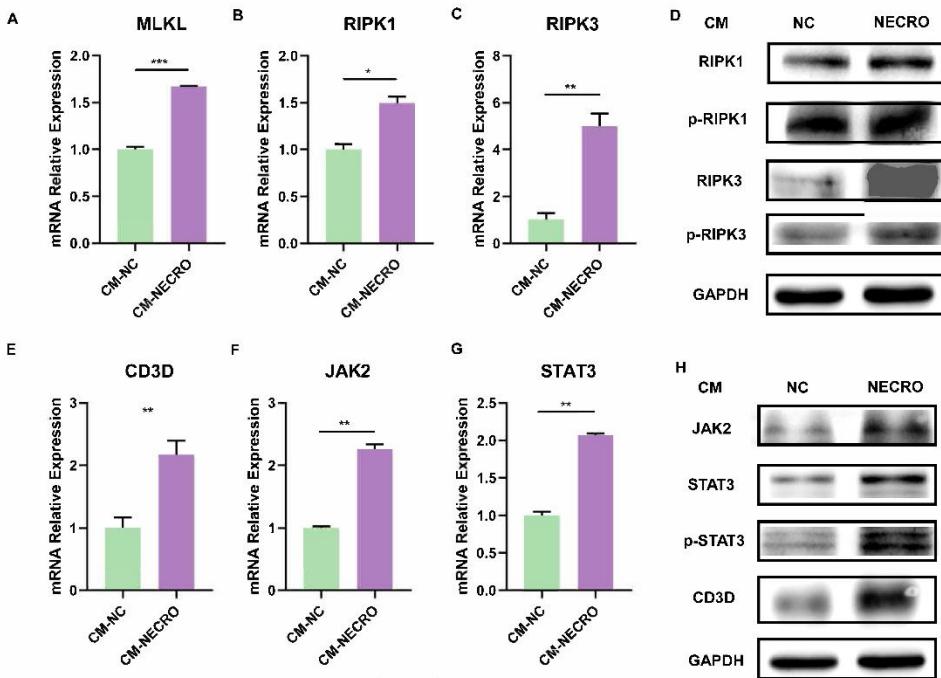

Fig. S6: CC cells undergoing necroptosis activated the necroptosis signals and the JAK2-STAT3 signaling pathway of Jurkat cells. (A-C) RT-qPCR results showed the expressing amount of MLKL (A), RIPK1 (B) and RIPK3 (C) was up-regulated in the treated group (p-Value: *** p < 0.001, ** p < 0.01, * p < 0.05, ns p > 0.05). (D) The protein level of RIPK1, p-RIPK1, RIPK3 and p-RIPK3 is much stronger in the treated group. (E-G) RT-qPCR results showed the expression level of CD3D (E), JAK2 (F) and STAT3 (G) got elevated in the treated group, with p-value <0.01(**). (H) The protein level of JAK2, STAT3, p-STAT3 and CD3D exhibited to increase in the treated group. Notes: “CM-NC” means Jurkat cells cocultured with the supernatant of SiHa CC cells (without any treatment), “CM-NECRO” means Jurkat cells cocultured with the supernatant of SiHa CC cells (pretreated with TNFa + Z-VAD-FMK at a concentration of 20 μ m the day before).

Table S1. Primer nucleotide sequence of this study.

Gene	Primer nucleotide sequence
GAPDH	Forward: 5'-CTGGGCTACACTGAGGCACC-3' Reverse: 5'-AAGTGGTCGTTGAGGGCAATG-3'
